

Proposed Solution – Your Project

Project Title: Script-Controlled ACL – Restrict Record Access Based on Field Value

Project Proposal (Proposed Solution) Report:

The proposed solution aims to improve the security of student and institution records in ServiceNow by implementing role-based and field-based access control. The system uses Access Control Lists (ACLs), user roles, and the Branch field to control who can view, create, update, and delete records.

Project Overview

Section	Content
Objective	To implement secure and controlled access to Institution Details records using ServiceNow ACLs, user roles, and Branch-based restrictions.
Scope	The project covers user and role creation, custom Institution Details table creation, and Read, Create, Write, and Delete ACL configuration.
Problem Statement – Description	Unauthorized users may be able to access or modify student records if proper role-based and field-based access controls are not implemented.
Problem Statement – Impact	Unauthorized access can affect the security and privacy of student information and may allow users to perform operations beyond their permissions.

Proposed Solution

Approach:

Implement Script-Controlled ACLs in ServiceNow to control record access based on user roles and the Branch field. Different roles are assigned different permissions for viewing, creating, updating, and deleting records.

Key Features:

- Custom **Institution Details** table.
- Branch field with **EEE, ECE, and CSE** choices.
- Roles **bb1, bb2, bb3, and bb4**.
- Read access controlled using ACL and script.
- Create access controlled using **bb2**.
- Write access controlled using **bb3**.

- Delete access controlled using **bb4**.
- Admin users have full access.
- Unauthorized users are restricted from performing protected operations.

Resource Requirements

Resource Type	Resource	Specification / Allocation
Software	ServiceNow	ServiceNow Developer Instance
Development Environment	ServiceNow	ServiceNow platform and application interface
Backend	Server-side JavaScript	Used for ACL scripting
Database	ServiceNow Database	Institution Details custom table
Security	ACL & Roles	bb1, bb2, bb3, bb4
Testing	ServiceNow Impersonation	Used to verify role-based access
