

Communication

Team ID: SWTID-2026-5919

Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Communication Plan

Effective communication is essential for successful project development and demonstration. The team maintained regular communication throughout the project lifecycle to coordinate ACL configuration, discuss progress, identify issues, and verify the implemented access-control functionality.

S.No	Communication Type	Frequency	Channel / Tool	Participants	Purpose
1	Team Standup	Daily	Team Discussion / Online Meeting	All Team Members	To discuss daily tasks, work completed, and upcoming activities.
2	Progress Update	Weekly	Team Discussion / Online Meeting	All Team Members	To review project progress, milestone completion, and pending tasks.
3	Issue / Bug Discussion	As Needed	Team Discussion / Online Meeting	Relevant Team Members	To discuss ACL configuration issues, access problems, and verification results.
4	Stakeholder Review	Bi-Weekly	Project Review / Online Meeting	Team Members and Stakeholders	To review the project implementation, receive feedback, and confirm milestone progress.
5	Final Demo Rehearsal	Once	Team Discussion / Online Meeting	All Team Members	To verify the complete ACL workflow and prepare for the final project demonstration.

The communication activities were aligned with the project milestones, including user and role creation, custom table creation, READ ACL configuration, CREATE ACL configuration, WRITE ACL configuration, and DELETE ACL configuration.

Communication Challenges & Resolutions

S.No	Challenge Faced	Resolution / Action Taken
1	Understanding the correct configuration of different ACL operations.	The team discussed the required READ, CREATE, WRITE, and DELETE permissions and verified each ACL configuration separately.
2	Verifying record access based on the Branch field and user roles.	The team used user impersonation to test EEE branch access and administrator access and compared the results with the expected behavior.
3	Coordinating the final verification of all ACL permissions.	The team reviewed the complete role combination and verified viewing, creating, editing, and deleting permissions before the final demonstration.

The project specifically uses impersonation to verify ACL behavior, including EEE-user access, users without the required role, and administrator access. The final verification also covers the combined bb1, bb2, bb3, and bb4 roles for the complete access-control workflow.
