Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Team ID: SWTID-2026-5919

Problem Statement	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A ServiceNow user who needs to access student records.	Access the student records related to my branch.	I may be able to access records that should be restricted.	There is a need for field-based and role-based access control.	Concerned about unauthorized access to student information.
PS-2	An administrator managing student records in ServiceNow.	Provide different levels of access to different users.	All users should not have the same permissions.	Users require different roles for Read, Create, Write and Delete operations.	Concerned about maintaining proper record security.
PS-3	A user responsible for managing EEE student records.	View and manage only the records I am authorized to access.	Unauthorized users may try to view or modify the records.	Access needs to be controlled using ACLs and user roles.	More confident when record access is properly controlled.
PS-4	A ServiceNow administrator.	Allow authorized users to perform required operations.	Giving excessive permissions can expose or change sensitive records.	Access must be separated for Read, Create, Write and Delete operations.	Responsible for ensuring secure record management.
PS-5	A student-record system user.	Access student information securely.	Unauthorized users may access or modify student information.	The system needs script-controlled access based	Concerned about data privacy and security.

				on roles and field values.	

Main Problem Statement

PS-1:

I am a ServiceNow user who needs to access student records. I'm trying to access only the records related to my authorized branch, but unauthorized records may be accessible because proper field-based and role-based access control is required, which makes me concerned about the security of student information.

This fits your project because the project specifically aims to control access to ServiceNow records using **ACLs, user roles, and field values**.
