

Demonstration of Proposed Features

Team ID: SWTID-2026-5919

Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Demonstration of Proposed Features

This document captures the proposed features of the ServiceNow project and records their implementation and demonstration status. The project focuses on controlling access to **Institution Details** records using ACLs, user roles, and the Branch field value.

S.No	Feature Name	Description	Status	Demonstrated	Remarks
1	Custom Institution Details Table	Create the u_institution_details table in the database with Student Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, and Address fields.	Implemented	Yes	Custom table created successfully with all required fields.
2	Script-Controlled READ ACL	Restrict record read access based on the Branch field and user role. Only users can access EEE Branch records if they are administrators.	Implemented	Yes	Scripted ACL applied successfully, restricting access based on Branch and role.
3	CREATE ACL	Control the creation of Institution Details records using the bb2 role.	Implemented	Yes	CREATE permission verified for users with the required role.
4	WRITE ACL	Control editing of Institution Details records using the bb3 role.	Implemented	Yes	WRITE permission verified for users with the required role.
5	DELETE ACL	Control deletion of Institution Details records using the bb4 role.	Implemented	Yes	DELETE permission verified for users with the required role.
6	Role-Based Access Verification	Verify access using the bb1, bb2, bb3, and bb4 roles through the script.	Implemented	Yes	Access control workflow verified through script execution.

Feature Implementation Summary

Metric	Result
Total Features Proposed	6
Total Features Implemented	6
Total Features Demonstrated	6
Overall Implementation Rate (%)	100%

Demonstration Summary

The implemented features demonstrate controlled access to ServiceNow records through **READ, CREATE, WRITE, and DELETE ACLs**. Access is controlled using user roles and field-based conditions, with verification performed through user impersonation. The complete workflow ensures that unauthorized users cannot view or modify restricted records.
