

Scalability & Future Plan

Date: 15 March 2026

Team ID: SWTID-2026-5919

Project Name: Script-Controlled ACL – Restrict Record Access Based on Field Value

Maximum Marks: 1 Mark

Scalability & Future Plan

This document outlines how the current ServiceNow ACL solution can be scaled to support larger numbers of users, increased Institution Details records, and additional access-control requirements. It also presents a future roadmap for extending the current role-based and field-based security implementation.

Current System Limitations

S.No	Limitation	Impact	Priority to Address
1	The current ACL configuration is implemented for the Institution Details table as a separate field-based rule.	Added for the Institution Details table as a separate field-based rule.	High
2	Access rules currently focus on the Branch field and the configured, user, role record-level access requirements may not be sufficient.	More complex configuration, user, role record-level access requirements may not be sufficient.	Medium
3	Verification is performed through user input, and access control may require more systematic testing and monitoring.	Integration and manual configuration may require more systematic testing and monitoring.	Low

Scalability Plan

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	The project uses role-based access through role groups as the number of users increases.	Introduce additional roles, rules, and role groups as the number of users increases.
2	Data Storage	Institution Details records are stored in a single table.	Support larger institution details table containing appropriate data.
3	Performance	ACL checks are applied when users access data and user volume increases.	Review ACL script performance and optimize data and user volume.
4	Security	Security is controlled using ACL operations, roles, and rules.	Enhance security by introducing field-based or user-based access control.

Future Roadmap

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Extend ACL configuration to support additional roles, users, and branch-based access requirements.	Phase 1: 1 month	Improved access control as roles, users, and branch-based access requirements are implemented.
Phase 2	Introduce more detailed record-level or field-level access control for different user groups.	Phase 2: 2 months	Enhanced security for sensitive Institution Details records.
Phase 3	Strengthen testing and monitoring of ACL permissions and user access.	Phase 3: 3 months	Improved reliability and ability to identify unauthorized access.
Phase 4	Extend the solution to additional ServiceNow tables and integrate with other ACL requirements.	Phase 4: 4 months	Allow the ACL approach to be used across the entire ServiceNow environment.

Future scalability will focus on extending the current role-based and field-based ACL approach while maintaining secure access to ServiceNow records. The roadmap supports expansion to additional users, roles, tables, and access conditions without changing the core objective of controlled record access.
